

@shashikant.ai · design prompt kit

Make your AI website look **premium**

The prompt and the 7 free design sites from the reel. The AI has no good reference, so it builds the average website. Give it references and the result changes completely.

The 7 sites

7

navbar.gallery

Every kind of website menu: static, dropdown, mega menu, sidebar, full screen.

6

posts.design

Social posts from 670+ brands. Use them for card and section styles.

5

recent.design

The best new designs, picked every day (web, branding, motion, 3D).

4

cta.gallery

Call-to-action buttons and blocks that people actually click.

3

loadmo.re

Bold, non-boring mobile websites.

2

60fps.design

Small UI animations from real apps like Netflix and X. This is where the premium feel comes from.

1

jiro.build

Pick a design, copy its ready-made prompt, paste it into your AI.

Honest notes (checked 29 Sep 2026): jiro.build needs a free account to copy prompts and also sells a paid plan. 60fps.design is free to explore and has a PRO plan (\$15/month). The others are free to browse.

How to use the prompt

1. Copy the prompt below.
2. Change the brand name, city, colours, menu items and prices to yours.
3. Paste it into ChatGPT or Claude. In the reel, ChatGPT (Work mode) built the site in 9 minutes 34 seconds.
4. Open the HTML file it gives you in your browser. If something looks off, tell the AI exactly which section to fix.

Tip: swap any reference for one you found yourself. "NAVBAR (like navbar.gallery)" can become "NAVBAR like the Supaste navbar on navbar.gallery: a floating pill...".

The prompt

Build a landing page for my chai brand called Kulhad (Pune). It must look like an award-winning website (Awwwards / Apple product page level), not a template. Single HTML file.

Style references I studied, use these ideas:

1. HERO (like the best sites on recent.design): full-screen, near-black warm background (#0E0B09) with film grain.
A giant headline across the whole width, "CHAI, BUT CINEMATIC." in a heavy condensed font, letters revealing one by one from below with a mask. In the middle, a 3D-looking clay kulhad cup built with CSS/SVG (terracotta gradients, highlights, rim shadow) that slowly rotates and floats, with animated steam wisps rising (SVG paths + blur). The cup tilts slightly toward the mouse.
2. NAVBAR (like navbar.gallery): a floating glass pill at the top, blurred, that shrinks when you scroll.
Logo left, 3 links, one glowing "Order now" button right.
3. MOTION (like 60fps.design): buttery micro-interactions. A custom round cursor that grows over buttons,

magnetic buttons that pull toward the cursor, a press-down on click, sections that fade and slide up with

stagger as you scroll, numbers that count up.

4. SCROLL STORY (like loadmo.re, bold and not boring): a sticky section where, as you scroll, the cup stays pinned

and 3 big steps change beside it: "01 Crush the spices" → "02 Simmer 12 minutes" → "03 Pour into clay".

The background colour shifts from black to deep terracotta to cream as you scroll through it.

5. MARQUEE: a huge infinite scrolling text band "MASALA · ADRAK · ELAICHI · KULHAD ·" in outline letters.

6. MENU (like posts.design): 3 cards styled like premium brand posts, each with a bold price as the hero (₹45, ₹60,

₹80), a rich gradient background and a 3D tilt on hover.

7. CTA (like cta.gallery): a final full-width block with a massive line "Your first cup is on us." and one big

magnetic button "Claim free chai →".

Rules: 2 fonts max (one heavy condensed display font, one clean sans),

terracotta #C8553D + cream #F4E9DA + black,

everything animates smoothly at 60fps with transform/opacity only, respects prefers-reduced-motion, looks great on

a phone too. No stock photos, no emoji, no lorem ipsum, no fake reviews or ratings.

"Kulhad" is a demo brand made for the reel. Results vary with the AI model and plan you use.
